

Personal study · not live market data

06 — GFS (grandfather–father–son)

RSI on **three** timeframes. Default swing set: **monthly** / **weekly** / **daily**.

Bullish GFS (the 5-star sketch)

1. **Monthly RSI > 60** — grandfather bullish 2. **Weekly RSI > 60** — father bullish 3. **Daily RSI back near 40** (about 39–43 in scanner talk) — son is the dip 4. **Alert:** daily green candle at that inflection, ideally at support 5. **Idea:** buy strength above that candle's high; stop under its low 6. **First target language:** swing resistance and/or RSI back toward **60** on daily

If monthly and weekly are **not** both strong, it is **not** this setup. Skip.

Bearish mirror

1. Monthly RSI < **40** 2. Weekly RSI < **40** 3. Daily RSI rally near **60** 4. Bearish alert candle 5. Weakness below that candle's low; stop above its high

Other timeframe triplets (same law)

He allows the family on other clocks if the **ratio is ~4–6×**:

- Weekly / daily / hourly (swing)
- Daily / hourly / 15m (intraday)

This **offline pack is M/W/D only**. Don't invent hourly.

Practice on the chart pack

Tick: M>60? W>60? D near 40? If yes, is there an alert candle? Or the short mirror. Most names will be **no setup**. That is the point of looking at many charts.
